

## Colors in webpage

In a given webpage, you'll find five different paragraphs. Your task is to utilize CSS to apply specific colors to each of these paragraphs, as described:

- For the paragraph with ID `para1`, set its font color as `#0000CD` which is a deep shade of blue.
- The paragraph with ID `para2` should have a background color of `rgb(144, 238, 144)` that correspond to a soft shade of green.
- For `para3`, apply a text color `rgba(255, 0, 0, 0.5)` which is red with 50% transparency.
- The paragraph with ID `para4` should have a background color named 'yellowgreen'.
- Lastly, for `para5`, set the font color as `#FF6347` which is a hexadecimal value, and the background color as `rgb(135, 206, 235)` which is an RGB value. Choose contrasting colors for an aesthetically pleasing effect.

Hint: Make sure to research hexadecimal, RGB, RGBA, and named color values to accurately execute this task.
